

RISK vs. REWARD – Series Snapshot

RISK vs. REWARD is a high-stakes trivia game show where confidence is as important as knowledge.

In the standard one-hour format, two independent contestants each face 12 multiple-choice questions for a potential **\$1,000,000** prize. Answering correctly is only part of the challenge. After seeing each question and its four possible answers, contestants decide how much they trust their choice using a dynamic **Risk/Reward Slider**.

As the slider moves, contestants see how their decision changes the potential gain or loss—and the most and least they could win over the course of the game. They then lock in both their answer and risk level. The more they risk, the more they stand to gain if they're right—and the more they stand to lose if they're wrong.

As the stakes escalate, contestants constantly manage two things: **what they know and how sure they are that they know it**. Two equally knowledgeable players can follow dramatically different paths based on how they assess confidence and risk under pressure.

Blending trivia, psychological tension, and strategic decision-making, **RISK vs. REWARD** creates a viewing experience where audiences naturally play along, asking themselves not only:

“Do I know the answer?”

but also:

“How much would I risk on being right?”

Knowledge gets you in the game. Confidence determines how far you go.
